Diagnosis of Antibody-mediated Rejection

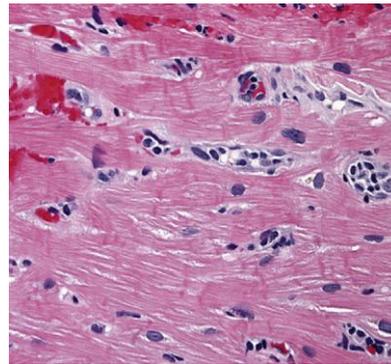

Clinical symptoms are vague, thus routine testing by means of endomyocardial biopsy are necessary

In contrast to acute cellular rejection (ACR) Diagnosis of AMR is more challenging

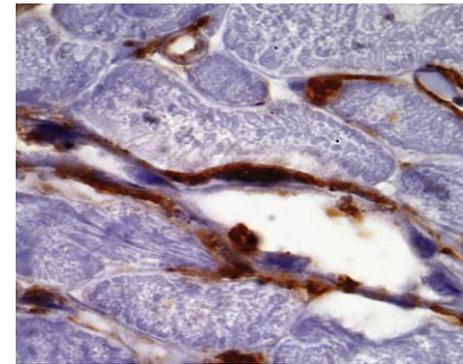

Pathological grading based on the presence of **histologic and immunologic findings only**

Hematoxylin and eosin (HE) stain (Paraffin) increased cellularity & intravascular macrophages

Hematoxylin and eosin (HE) stain (Paraffin) Activated mononuclear cells fill and expand vessels

Immunohistochemistry shows C4d (Paraffin) Uniform sub-endothelial localization of C4d is seen in capillaries

Farkash, E. A. & Colvin, R. B. Diagnostic challenges in chronic antibody-mediated rejection. *Nat. Rev. Nephrol.* 8, 255–7 (2012).

Berry, G. J. et al. The 2013 International Society for Heart and Lung Transplantation Working Formulation for the standardization of nomenclature in the pathologic diagnosis of antibody-mediated rejection in heart transplantation. *J. Heart Lung Transplant.* 32, 1147–62 (2013).

Challenges in Antibody-mediated Rejection

- C4d staining is of limited sensitivity, specificity and reproducibility
- Donor-specific anti-HLA antibodies are found in only 2/3 of biopsy-proven cardiac AMR cases
- Pathological grading lack clinical utility regarding graft survival
- Treatment protocols differ substantially by centers in terms of who and how to treat

Research Approach

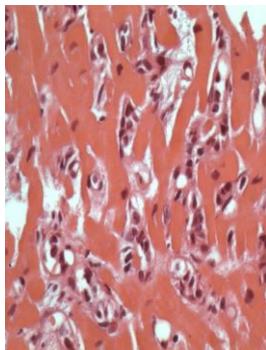

- Endothelial, NK cell transcripts are associated with DSA and histological features of microcirculation inflammation in renal transplants.
- NanoString nCounter technology allows multiplex gene expression quantification in FFPE biopsies

A literature-based gene expression profile potentially identifies antibody-mediated tissue injury accurately.

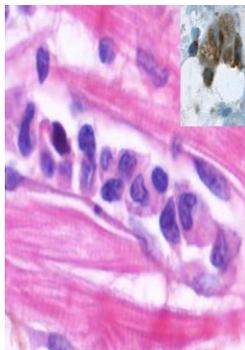

Gene Expression Profiling for the Identification and Classification of Antibody-Mediated Heart Rejection

- Multicentric study (5 French referral centers) 2004 – 2011
- 617 patients screened
- Cases: Heart ABMR (ISHLT)
- Matched controls: Non ABMR (Normal EMB – TCMR EMB)

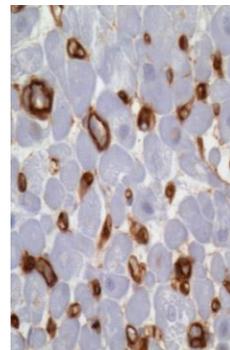

Histological phenotype

Microcirculation inflammation

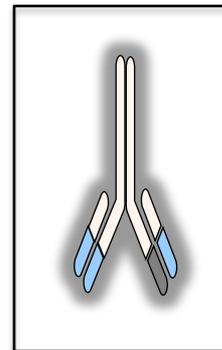

Intravascular CD 68
CD 163
CD 3, CD 20

Complement activation (C4d / C3d)

DSA phenotype

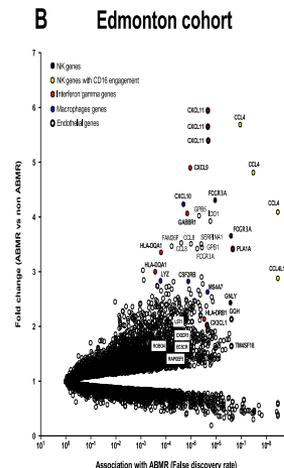

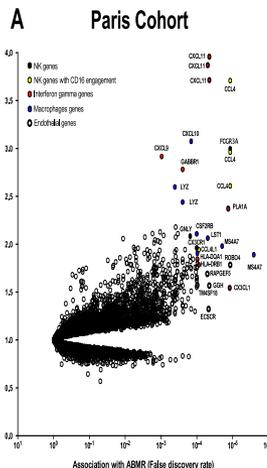

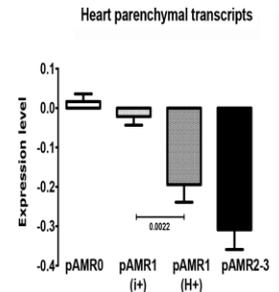

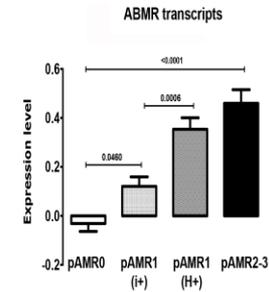

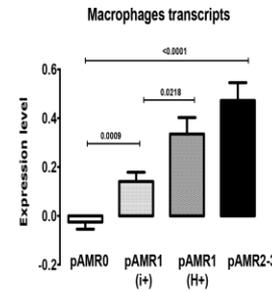

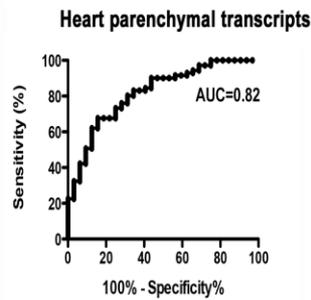

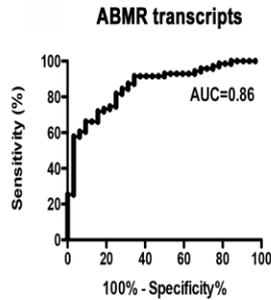

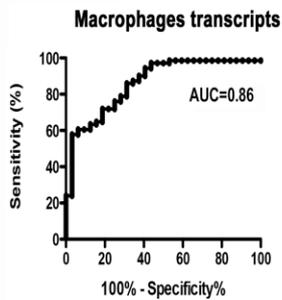

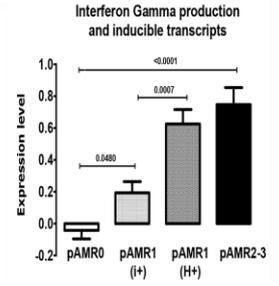

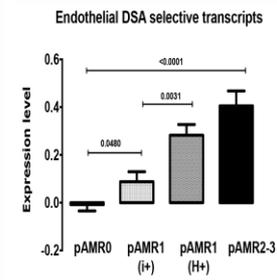

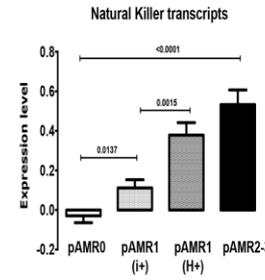

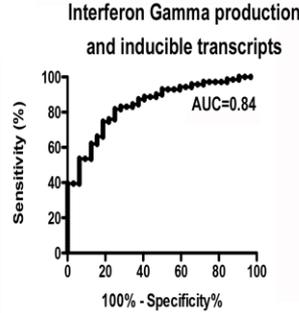

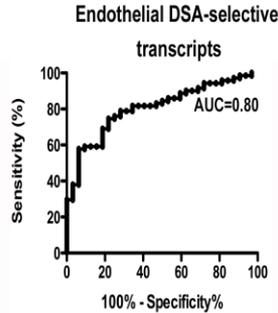

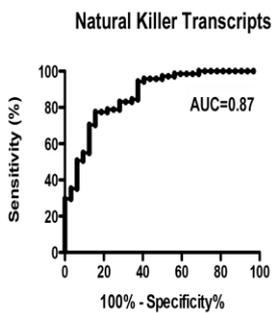

Luminex SA Specificity Class / MFI

Molecular phenotype

Transcripts PBT's Classifiers

Allograft gene expression correlates with AMR diagnosis with the molecular AMR architecture being highly conserved

NanoString nCounter technology

1

HYBRIDIZE

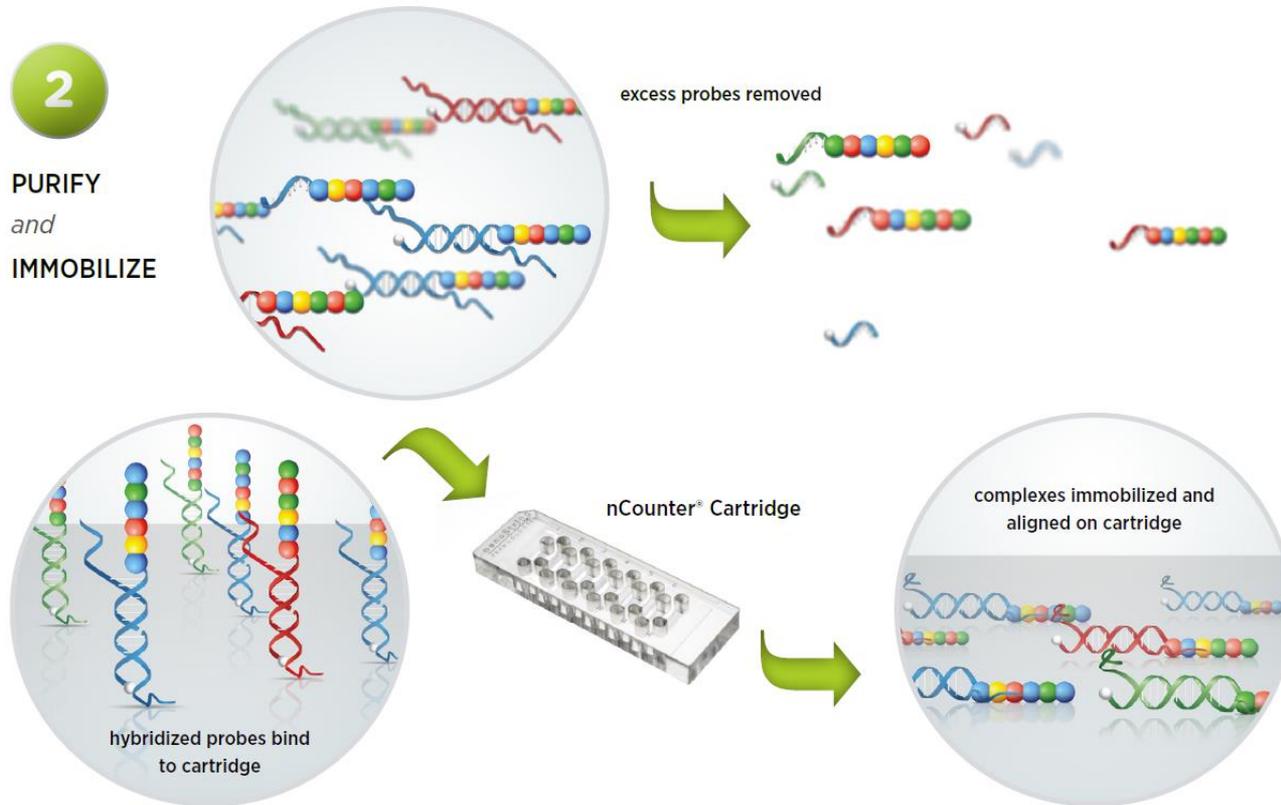

solution phase hybridization

Hybridization

Barcoded probes hybridize directly to a target molecule in solution. The **Reporter Probe** carries the signal and the **Capture Probe** allows the complex to be immobilized for data collection.

NanoString nCounter technology

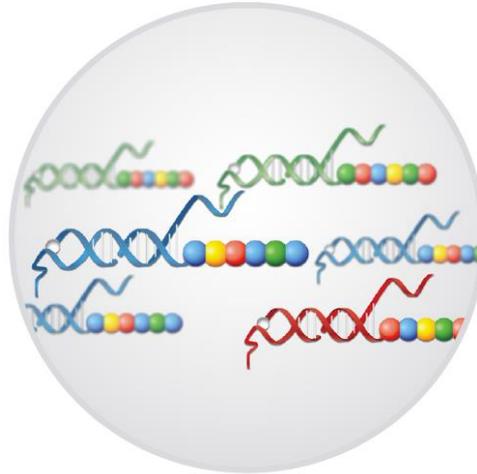

Sample Processing

After hybridization, samples are transferred to the nCounter Prep Station where excess probes are removed and probe/target complexes are bound, immobilized and aligned on the nCounter Cartridge.

NanoString nCounter technology

3

COUNT

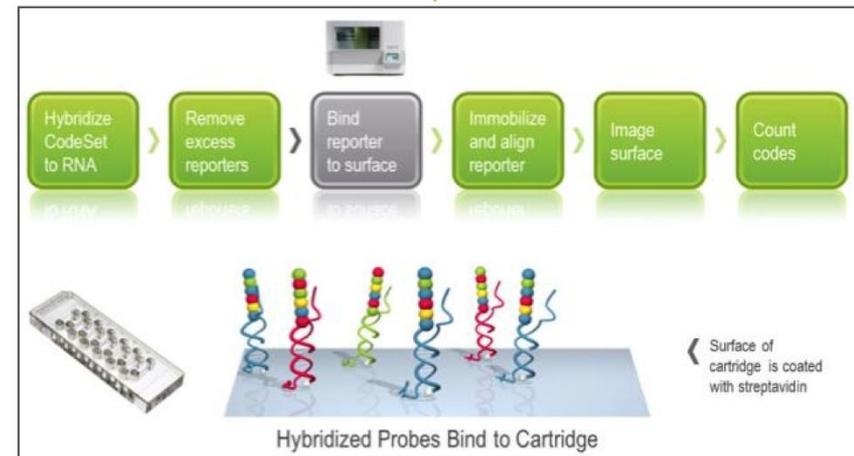

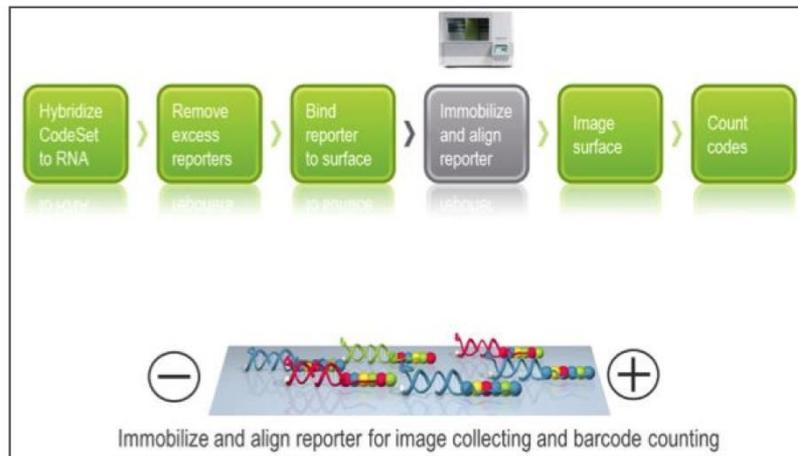

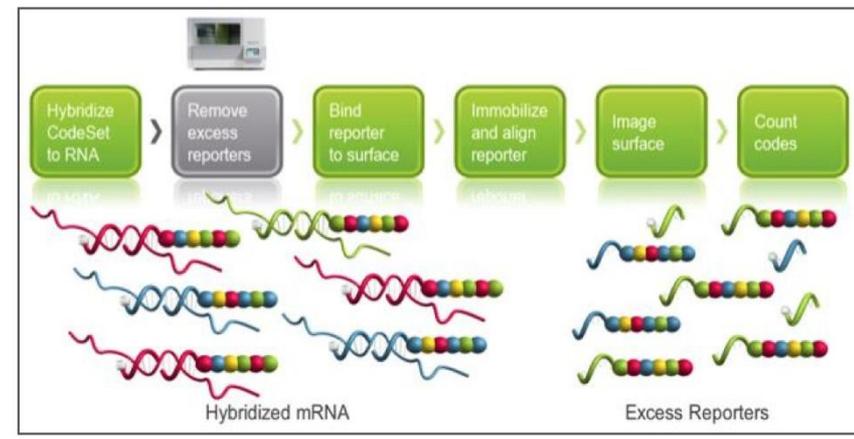

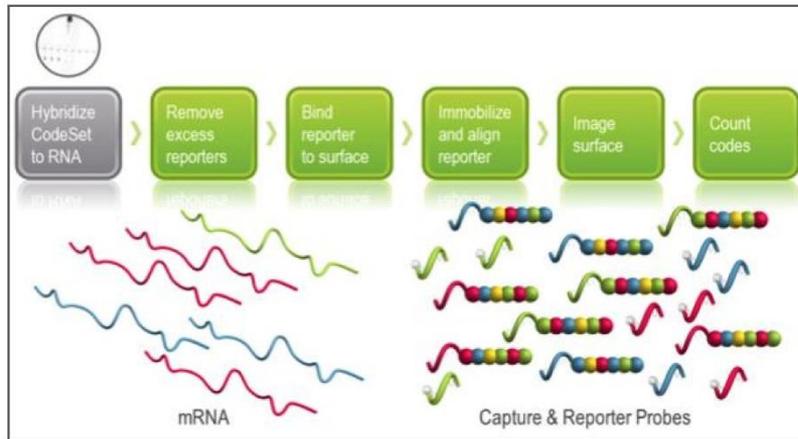

Barcode	Counts	Identity
	3	XLSA
	2	FOX5
	1	INSULIN

Digital Data Acquisition

Sample cartridges are placed in the nCounter Digital Analyzer for data collection. Barcodes are counted and tabulated for each target molecule.

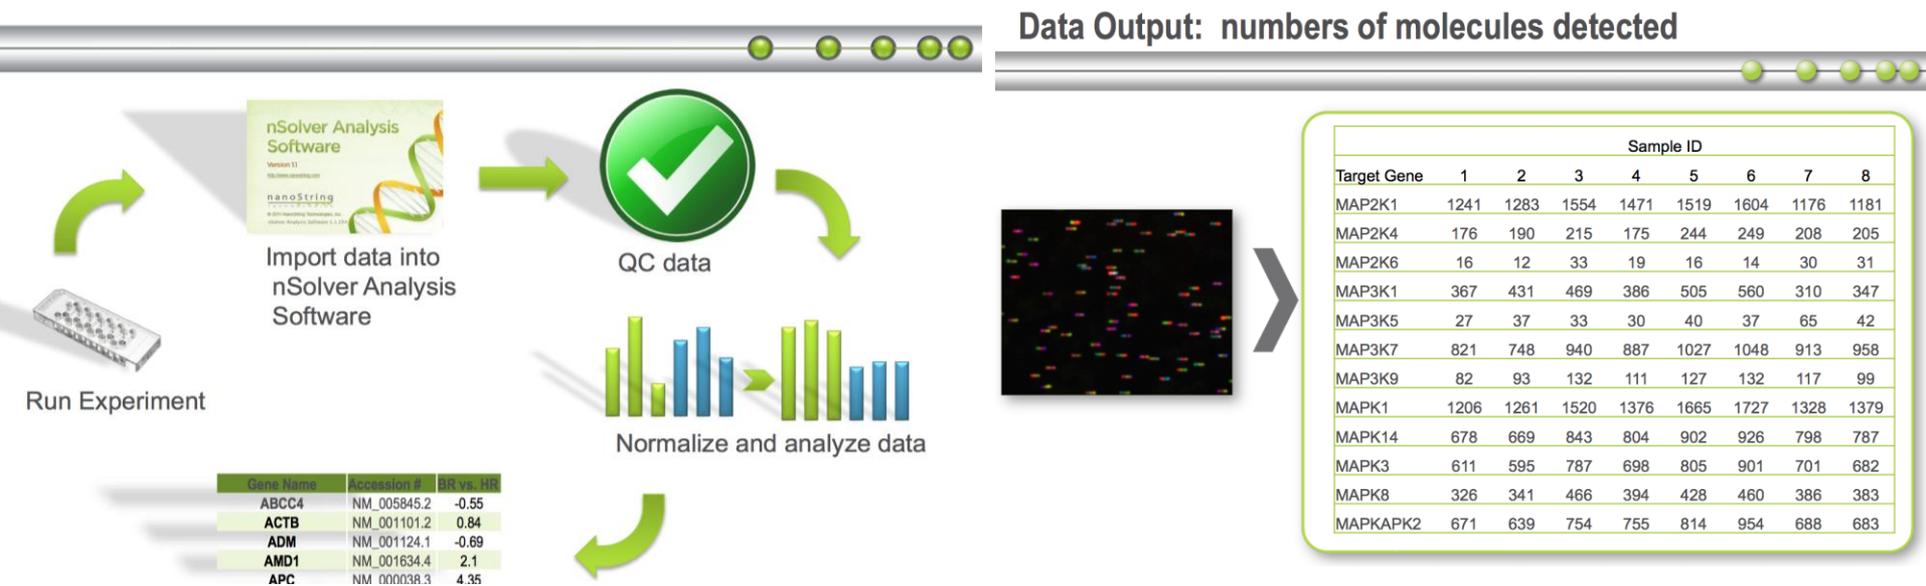

NanoString nCounter technology

Analytics software

nSolver™ Simple results- simple analysis

Gene Name	Accession #	BR vs. HR
ABCC4	NM_005845.2	-0.55
ACTB	NM_001101.2	0.84
ADM	NM_001124.1	-0.69
AMD1	NM_001634.4	2.1
APC	NM_000038.3	4.35

Sample Size

- 127 RNA extractions from 135 compiled blocks
 - 6 with no material on block, 1 explant sample, 1 only fibrotic tissue from prior biopsy site (3 adult, 5 pediatric biopsies)
- Selected 120 samples with highest RNA concentration (measured with NanoDrop 2000c)

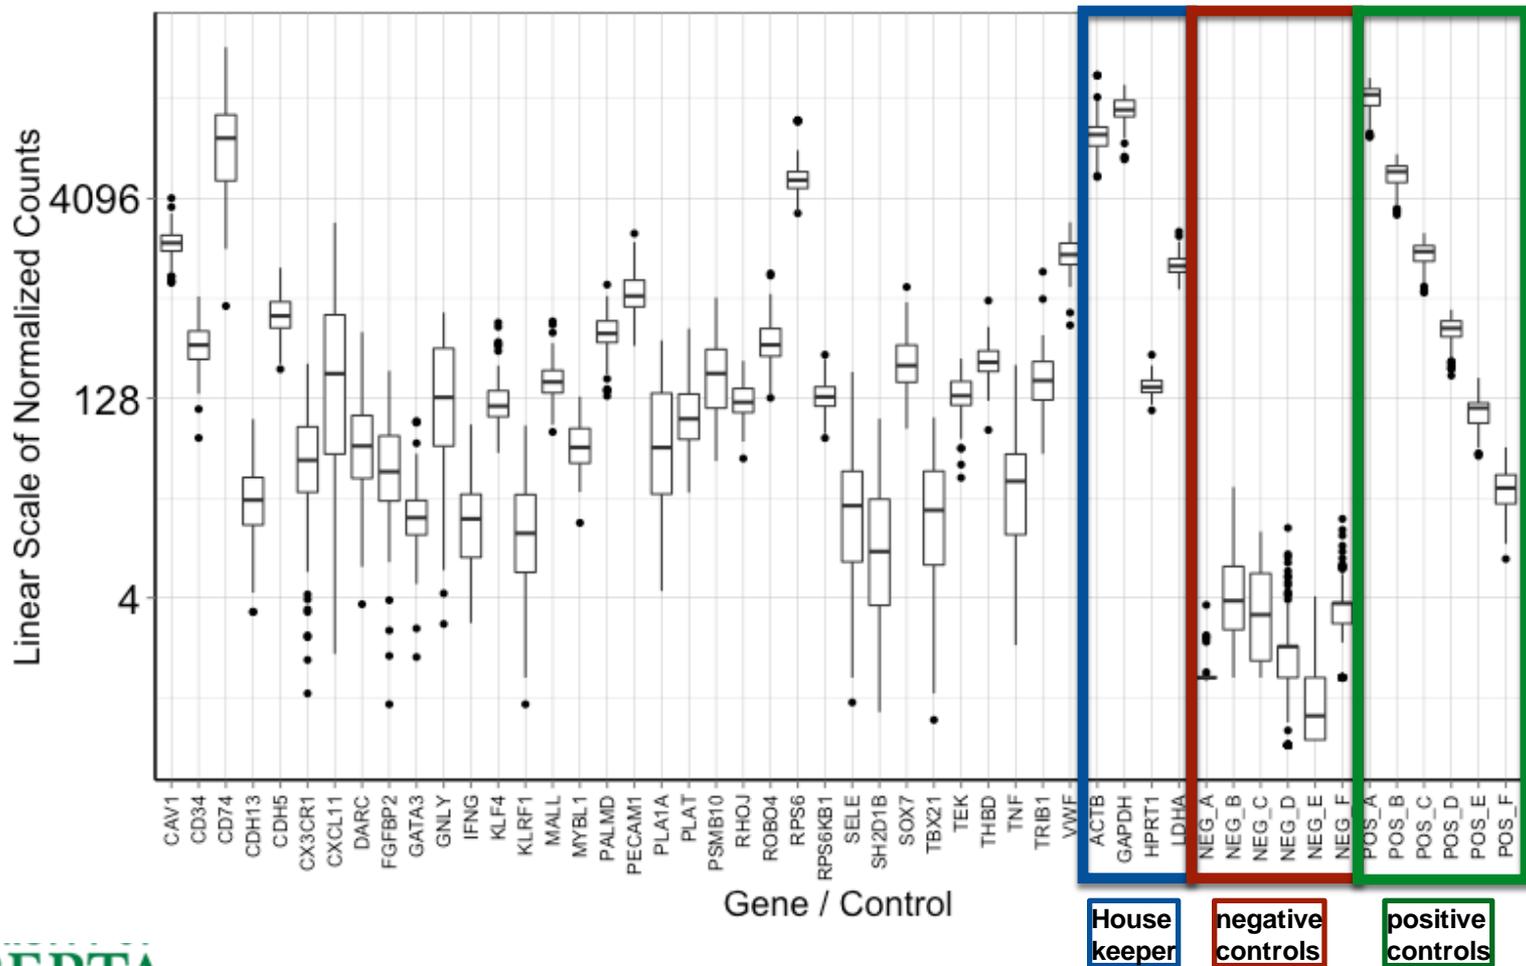

n=120	Concentration (ng/ μ l)	Purity A(260/280)
Minimum	3.3	1.52
Median	10.5	1.85
Mean	12.04	1.87
Max	42	3.11

- 120 total samples in 10 NanoString runs
 - 0 QC failures
 - 4 calibration repeats excluded
 - 9 pediatric cases excluded
- **107 unique samples, 69 patients**, 3306 datapoints
- Including 56 sequential biopsies from 18 patients

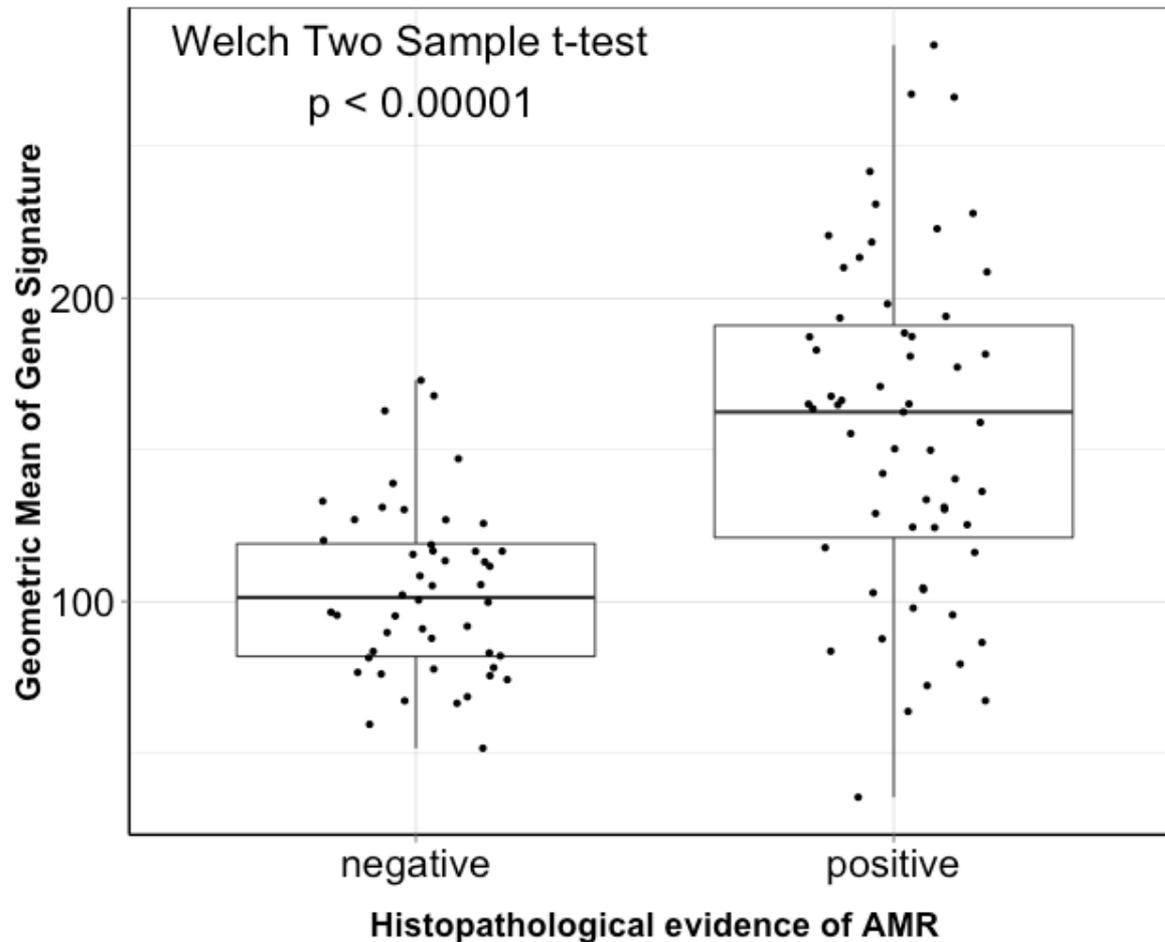

Rejection Diagnoses

n=107	AMR Histopathology	C4d+ and/or CD68+	ACR Grade 0R / > 0R	DSA pos / neg / na	n
pAMR2	pos	pos	11 / 11	17 / 5 / 0	22
pAMR1 (H+)	pos	neg	11 / 26	14 / 21 / 2	37
pAMR1 (I+)	neg	pos	5 / 6	4 / 6 / 1	11
ACR	neg	neg	0 / 22	2 / 14 / 6	22
Normal	neg	neg	15 / 0	1 / 12 / 2	15

Robust counts of positive controls, low counts of negative controls

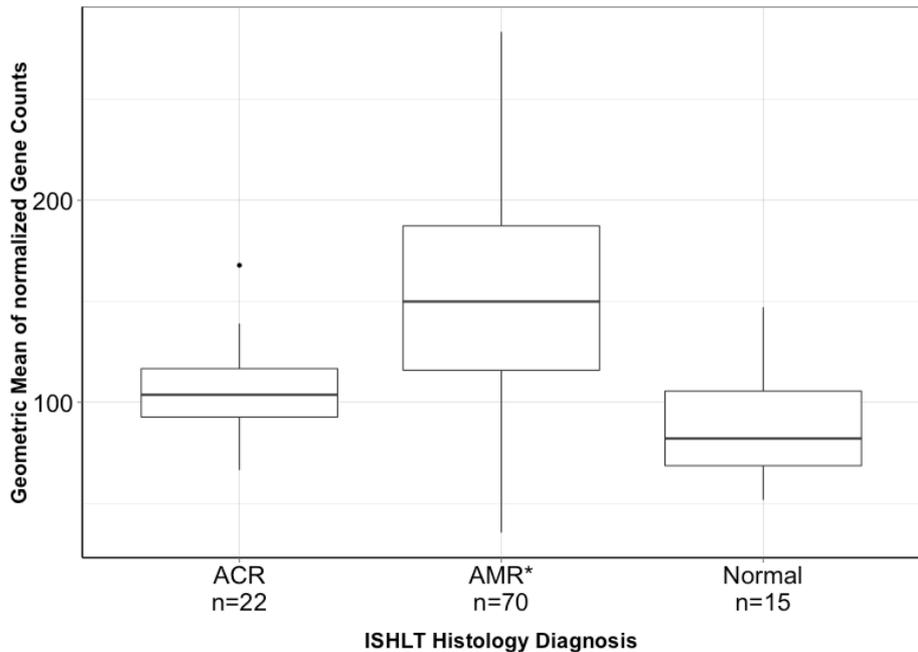

Gene Expression & AMR Histopathology

Histologic findings of AMR are associated with higher gene set expression.

Gene Expression between AMR and ACR or Normal Controls are Significantly Different

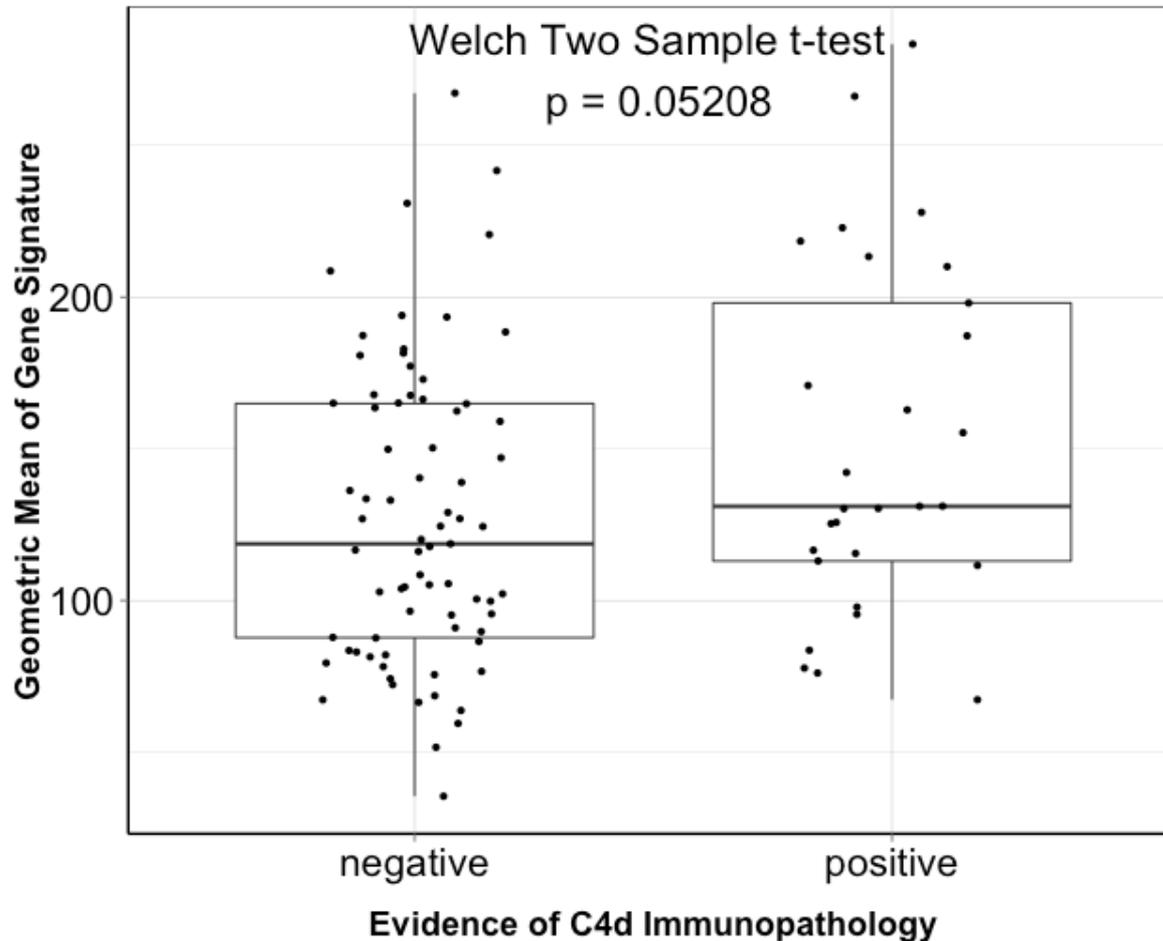

* pAMR2, pAMR1 H+, pAMR1 I+, concomitant with ACR (n=43)

Diagnoses	ACR	AMR
AMR	0.0009	-
Normal	0.17	<0.0001

Pairwise comparisons of Geometric Means of Gene Signature using t tests with pooled SD
P values (adjustment method: holm)

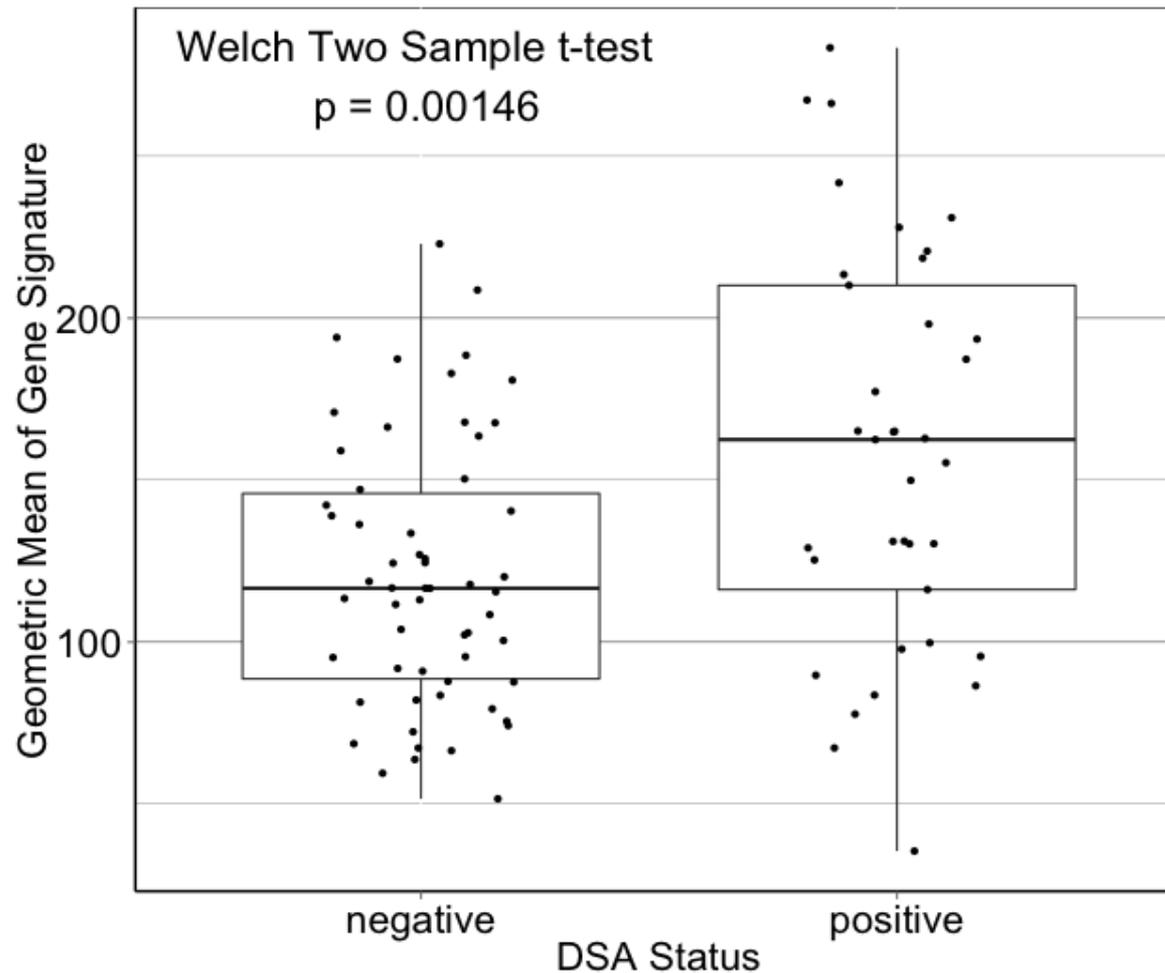

Gene Expression & AMR Immunopathology

Borderline association of C4d evidence and higher gene set expression.

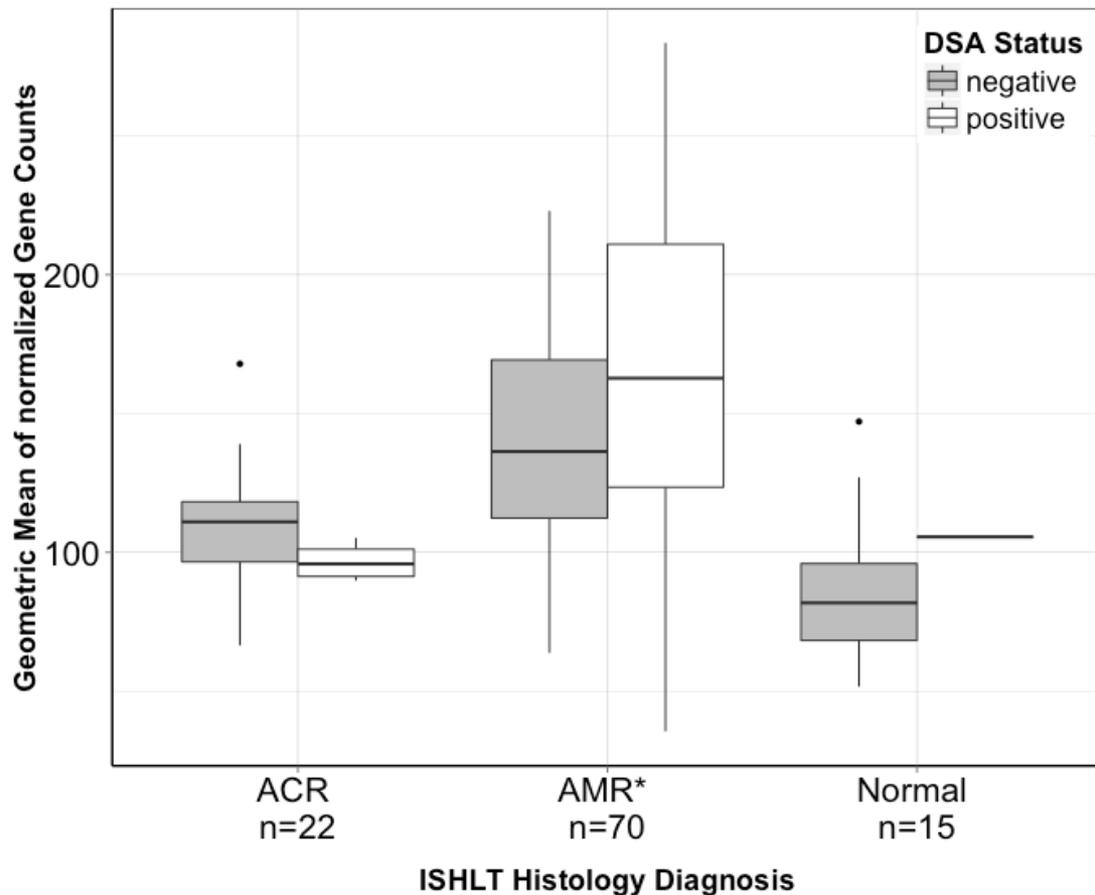

Gene Expression & DSA Status

Higher Expression in DSA-positive Cases

Gene Expression of ACR, AMR, Normal

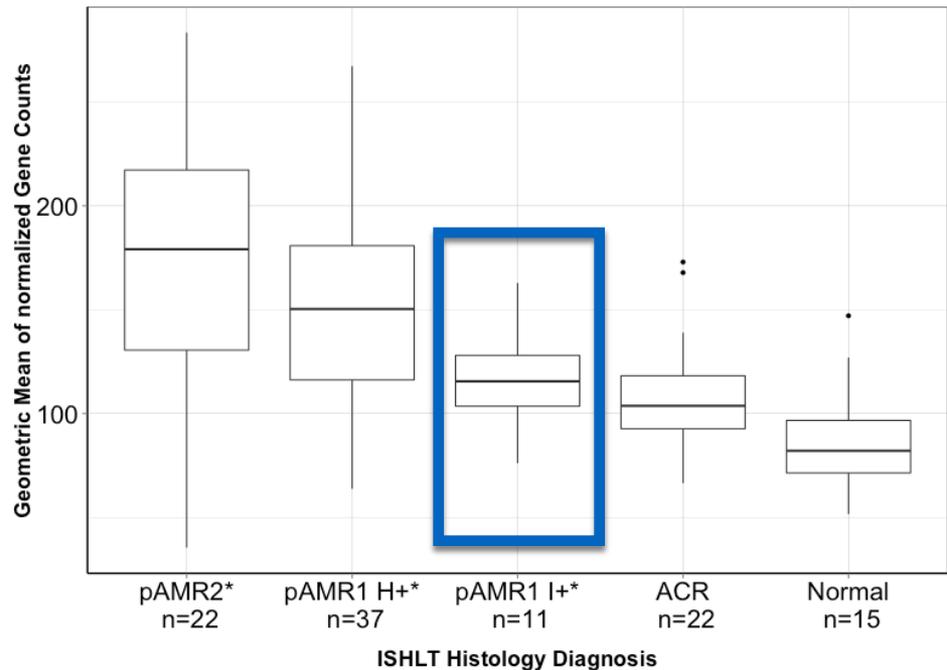

No differences due to Presence of DSA

Differences between DSA-positive and DSA-negative cases within ACR ($p=0.1822$) or AMR ($p=0.06452$) group were not significant.

* pAMR2, pAMR1 H+, pAMR1 I+, concomitant with ACR (n=43)

Significant Differences in Gene Set Expression across 2013 ISHLT Classification Groups

* AMR concomitant with ACR: pAMR2 (n=11), pAMR1 H+ (n=26), pAMR1 I+ (n=6)

Diagnoses	ACR	pAMR2	pAMR1h	pAMR1i
pAMR2	0.0001	-	-	-
pAMR1h	0.0077	0.26	-	-
pAMR1i	0.76	0.0053	0.13	-
Normal	0.41	<0.0001	0.0001	0.41

Pairwise comparisons of Geometric Means of Gene Signature using t tests with pooled SD
P values (adjustment method: holm)

pAMR1 I+ cases are neither different from pAMR1 H+ nor from ACR or normal controls.

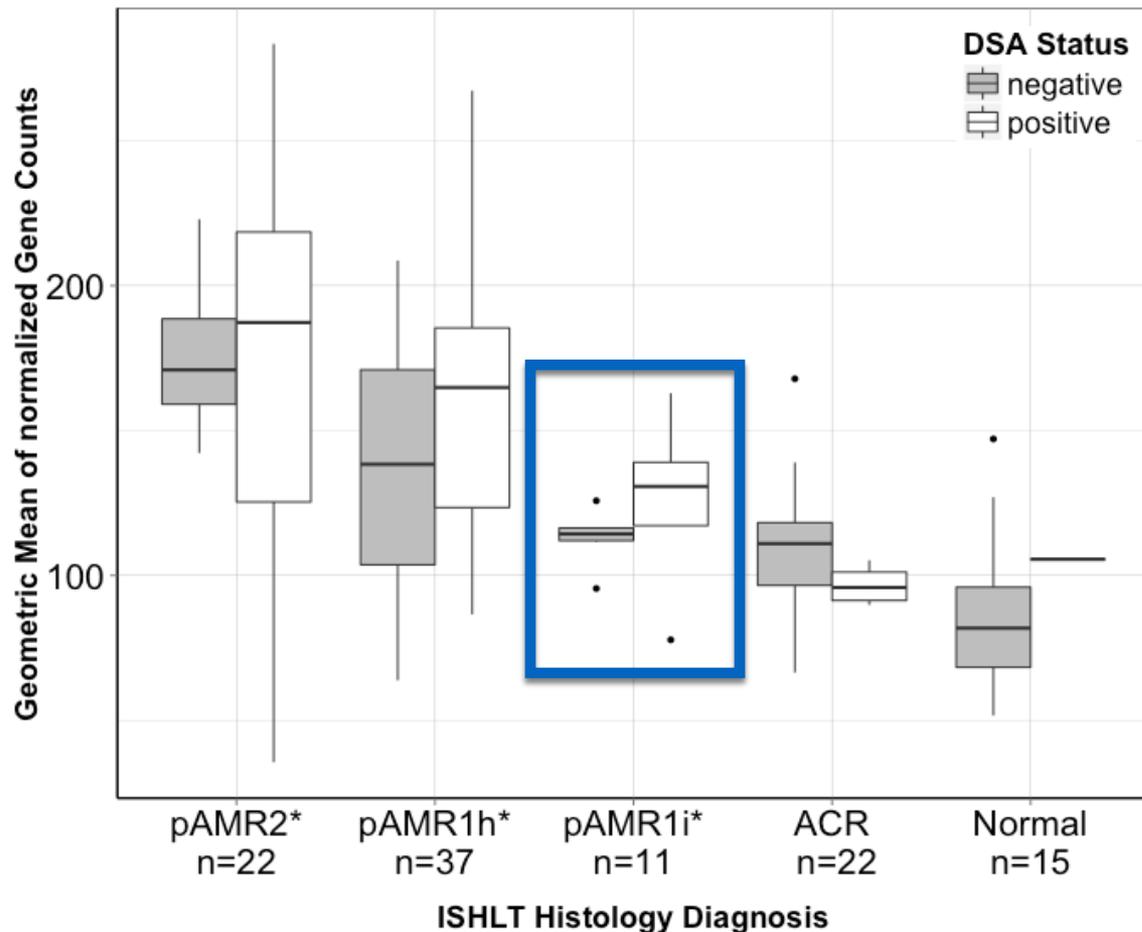

Presence of DSA Plays Minor Role in Gene Set Expression

No differences between DSA-positive and DSA-negative cases within any specific AMR diagnosis.

pAMR1 I+ cases are neither different from pAMR1 H+ nor from ACR or normal controls.

DSA-positive pAMR1 I+ appears to have higher expression ($p=0.5351$).

More such cases need to be studied!

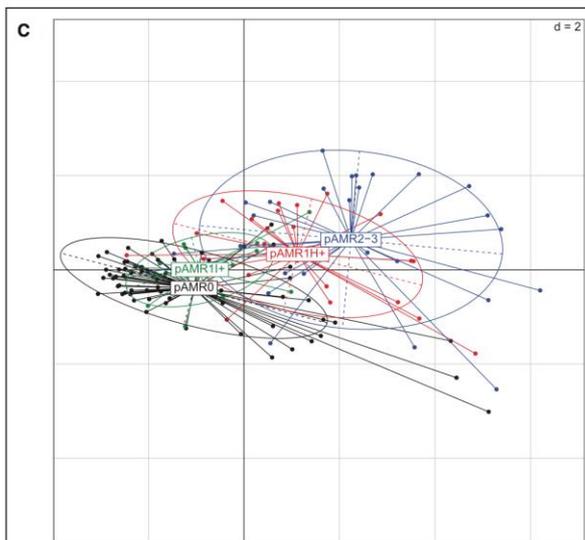

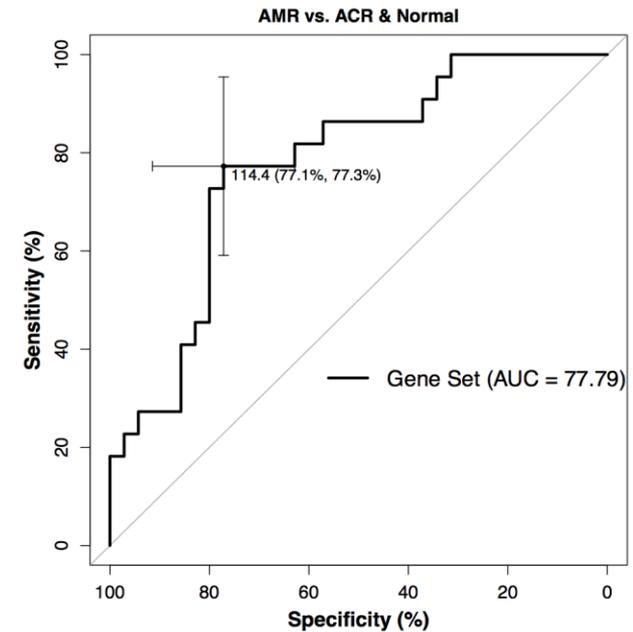

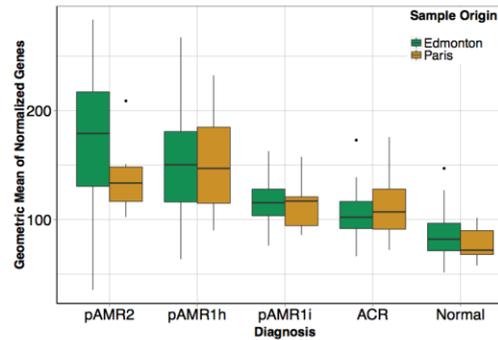

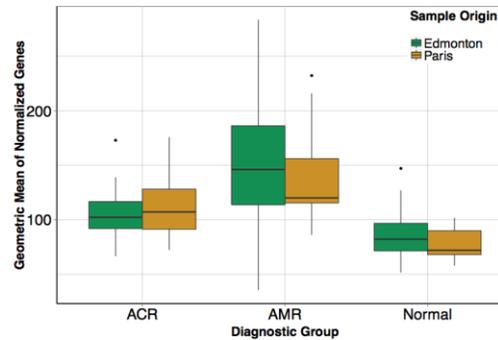

* AMR concomitant with ACR: pAMR2 (n=11), pAMR1 H+ (n=26), pAMR1 I+ (n=6)

Validation set

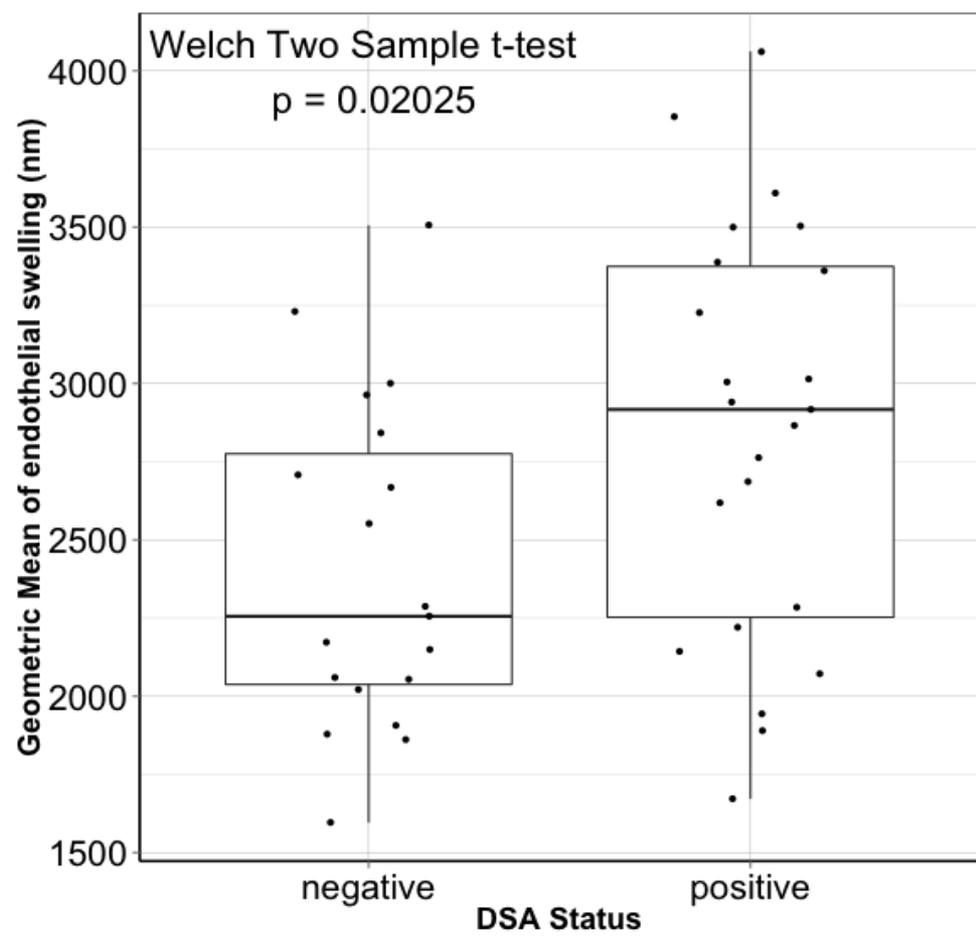

TRAINING SET VS. TEST SET

RESULTS: TEST SET CONFIRMS FINDINGS

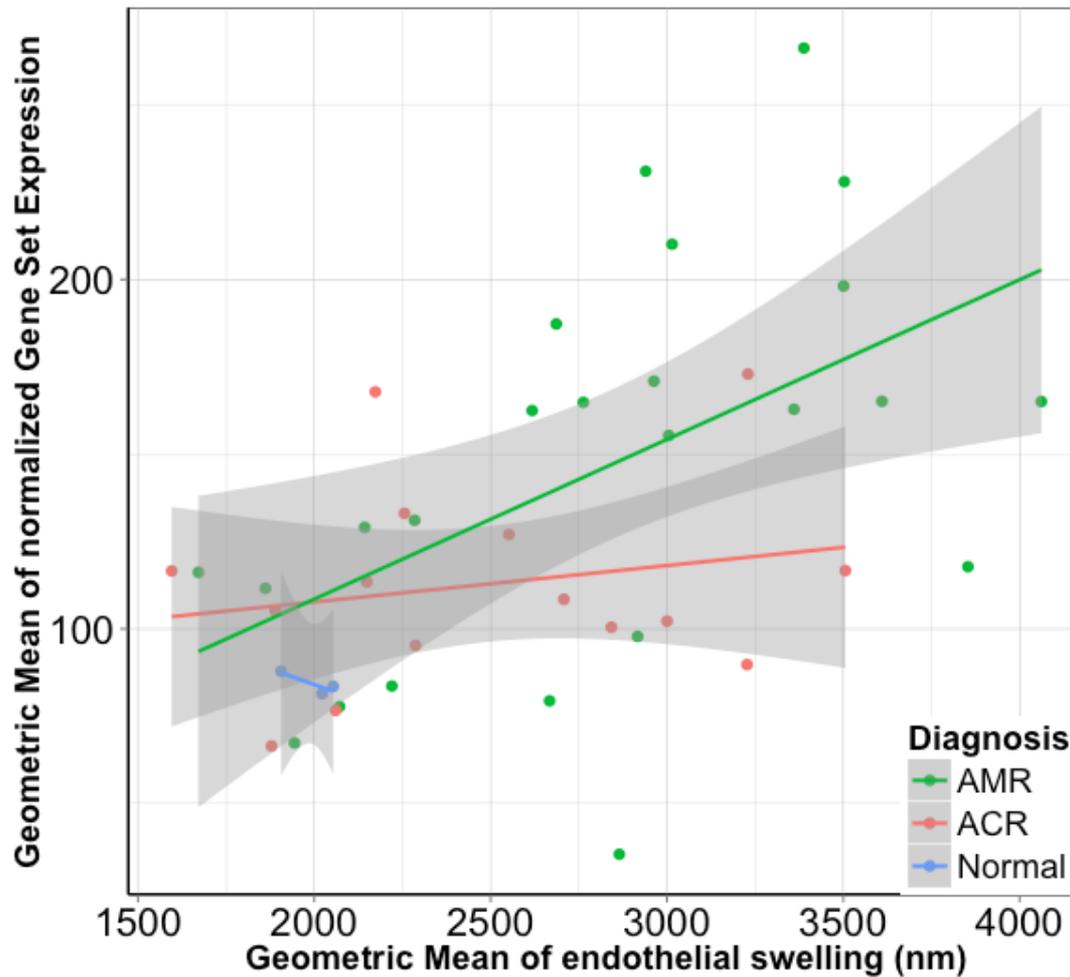

DSA presence overall is associated with Endothelial Swelling

Endothelial Swelling correlates with AMR Gene Set expression

Correlation is specific to antibody-mediated rejection

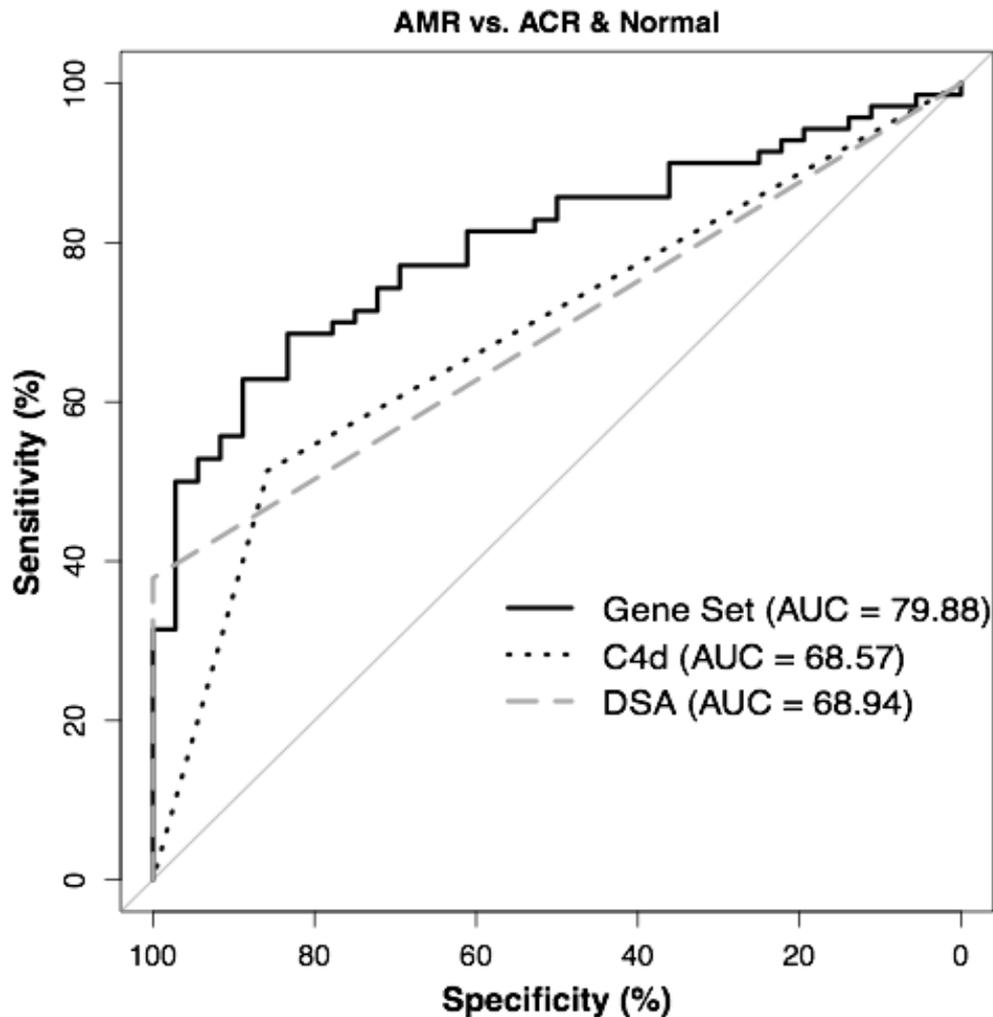

AMR: $\rho=0.616$, $p<0.01$

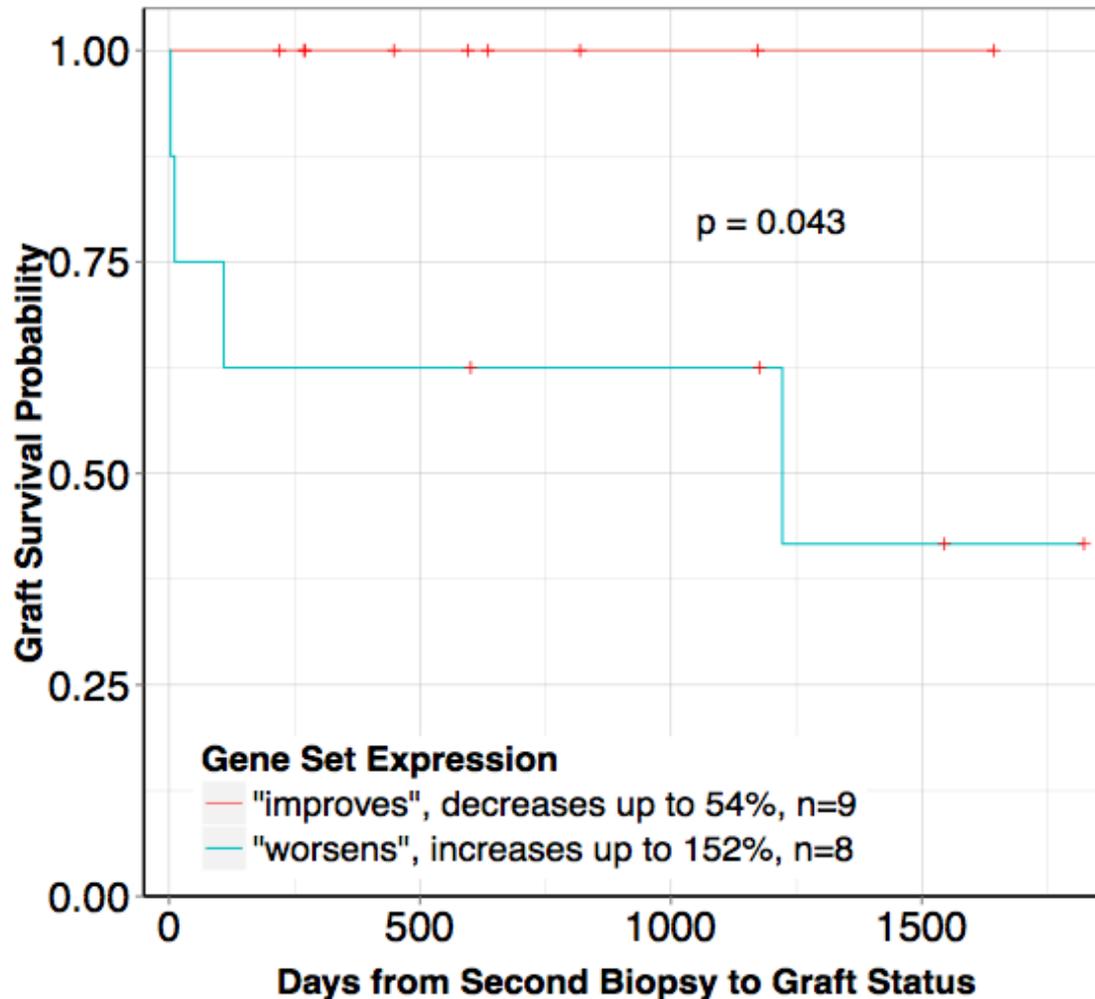

ACR: $\rho=0.221$, $p=0.43$

Normal: $\rho=-0.5$, $p=1$

Comparison of ROC Curves Gene Set, DSA and C4d

Increase of Gene Set Expression is Significantly Associated with Graft Failure

Predicting Graft Survival by Combining All Available Diagnostics Improves Specificity
